

Catálogo de Aplicaciones Bujías de Precalentamiento

Bujías de precalentamientro Descripción técnica del producto

Magneti Marelli ha creado una gama completa de bujías de precalentamiento diseñadas y fabricadas conforme a los estándares cualitativos internacionales, garantizando una amplia cobertura de vehículos circulantes. Todas las bujías de precalientamento de Magneti Marelli llevan un doble filamento y pueden permanecer encendidas el tiempo necesario que establezca la centralina después de la puesta en marcha del motor.

- ☑ Arranques en frío inmediatos, incluso en condiciones climáticas muy duras
- ☑ Reducción de los consumos y de las emisiones contaminantes
- ☑ Larga duración

Principio de Funcionamiento

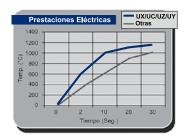

- Cuerpo doble base de apoyo y recubrimiento especial aislante. Asegura perfectas características de estanqueidad y aislamiento.
- **2 Funda en superaleación anticorrosiva térmica y química.** Espesor variable en función de la temperatura específica para cada motor, que se desarrolla en el interior de la precámara.
- Olvo aislante (Mg 0) a alta compresión. El compactamento, que elimina las intercapas de aire que perjudican la duración del filamento y que aisla perfectamente la espiral, es de particular importancia para la calidad exigida a una bujía de precalentamiento.
- 4 Filamento calentador. Calienta rápidamente la mezcla para obtener un encendido rápido, incluso en condiciones extremas y mantiene alta la temperatura del motor una vez en marcha obteniendo emisiones más limpias.
- 5 Filamento regulador. Gracias a sus características de resistencia controla el aumento de la temperatura para calentar la mezcla lo más rápido posible y así permitir que la bujía se mantenga caliente hasta 3 minutos sin riesgo de sufrir daños.
- Soldadura del filamento, de calidad y control constante. Realizada con proceso automatizado mediante fusión al láser.

Prestaciones Eléctricas UX/UC/UZ/UY

MAGNET Ultra rápidas DOBLE FILAMENTO

La sinergia de estos componentes reduce el tiempo de espera logrando un funcionamiento óptimo a partir de los 2 segundos, otorgando un mejor rendimiento del motor y una significativa disminución de la descarga de gases incombustos.
